LEARNING OBJECTIVE: We will construct linear functions based on verbal descriptions of data and identify the rate of change and initial value. (G8M6L1)

ACTIVATING PRIOR KNOWLEDGE

We can find the equation for a line if we know two points that it passes through.

Find the equation fo	r the line that pass
through the two poin	nts $(-1,5)$ and
$\sqrt{2,14}$	V4/~
1 10 - 1	
M= 14-5 = 9 = 3	Y=3x+b
3-(-1) 3	
	14=3(a)+b
17=3x+81	14=6+6
	b=8
	0

Find the equation for the line that passes through the two points
$$(4,6)$$
 and $(-2,9)$.

$$M = \frac{9 - 1}{2 - 4} - \frac{3}{2} - \frac{1}{2}$$

$$Q = -\frac{1}{2}(-2) + \frac{1}{2}$$

$$Q = 1 + \frac{1}{2}(-2) +$$

CONCEPT DEVELOPMENT

We can construct linear functions from verbal descriptions and stories. There is a structure and method to creating these functions. *Example:*

Story: Serena just purchased a new smartphone, and she is considering different wireless plans from Verizon, AT&T, and others. Text messaging is very important to Serena, and her wireless carrier must have a competitive plan. Verizon charges a monthly service charge PLUS an amount for each text Serena sends or receives...but their advertising does not say how much the monthly service charge is. On the Verizon website, she does see that her total charges for the month if she sends 300 texts would be \$18.00, if she sends 400 texts, it would be \$21.00, and if she sends 500 texts, it would be \$24.00.

Graph: If we were to try to graph these data points, what variable would be on the *x*-axis?

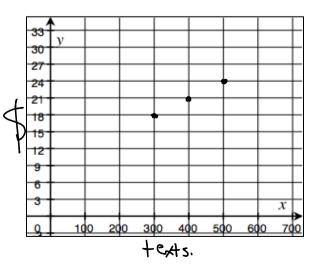

texts

What variable would be on the *y*-axis?

0657

Why do we only need to graph the problem in quadrant 1?

Can't send negative

Mr. Rogove

Table: Can we use a table to help define our function?

Number of	Total Cost for
Texts (x)	Texting (y)
0	\$ 9.00
100	\$12.60
200	\$15.00
300	\$18.00
400	\$21.00
500	\$24.00
600	\$27.00
700	\$30.00

How much does it cost to send each text message?

$$\frac{24-18}{500-300} = \frac{6}{200} = \frac{3}{100} = $.03$$

How much is monthly service charge? This is the price when you have not sent any text messages.

RATE OF CHANGE: This is the *slope* of the line and describes change in the values of y for every one unit increase in the values of x. It is the coefficient of x. (in this case, how the price changes depending on the number of texts)

When the rate of change is **positive**, the linear function is **increasing**. When the rate of change is **negative**, the linear function is **decreasing**.

Rate of change (slope) is .03.

INITIAL VALUE: This is the *y-intercept* of the line. It is a constant value of *y* when *x* is 0. This is the value of *y* when *x* has no impact.

Initial Value (x-int.) is 9

Equation: We can now build an equation if know the rate of change and initial value. The equation that represents the linear function will be in the form y = mx + b.

What is the linear equation that models the relationship between the cost Serena pays and the <u>number</u> of text messages she sends and receives?

Date: _____

GUIDED PRACTICE

Steps for Modeling Linear Relationships

- 1. Read the story carefully.
- 2. Create a table of values and/or graph the points on a coordinate plane.
- 3. Identify the rate of change and the initial value.
- 4. Create an equation to represent the function.

A band is paid a flat fee for playing at a concert. Additionally, they get a fixed amount of money for every ticket sold. If 40 tickets are sold, they will be paid \$200, and if 80 tickets are sold, they will be paid \$280.

a. Create a table of values

Tickets	Money paid
Sold	to band
0	120
20	160
40	200
60	240
80	780

b. Determine the rate of change. What does the rate of change MEAN in the context of the story?

$$\frac{80-200}{80\cdot40} = \frac{80}{40} = 2$$

they get \$2 tor every troper.

c. Determine the initial value. What does the initial value MEAN in the context of

the story.
$$Y = 2x+100$$
 $Y = Mx+b$
 $Y = 2x+100$

The band gets

 3120 foc
 $300 = 2(40)+b$

Showing up?

Thinking about the example on pages 1 and 2, Serena is also considering AT&T's plan. Like Verizon, AT&T charges a monthly service charge and a per text fee. AT&T's plan would cost \$36.00 for 600 text messages, \$40.00 for 700 texts, and \$44.00 for 800 texts.

a. Fill in the table of values below.

Number	Total cost
of texts	for texting
0	\$12
660	\$36
700	\$40
860	\$44

b. Determine the rate of change. What does that MEAN in the context of the

story?
$$\frac{60-700}{44-40} = \frac{100}{4} = 25$$

 $\frac{44-40}{600-760} = \frac{4}{100} = .04$

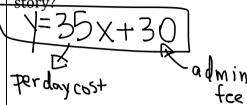

c. Determine the initial value. What does it MEAN in the context of the story.

d. Is Verizon better than AT&T?

A rental car company offers a rental package for a mid-size car. The cost is comprised of a fixed \$30 administrative fee for cleaning and maintenance of the car, plus the rental cost of \$35 per day.

a. Write a linear function to represent this situation. What does the slope MEAN in the context of the story? What does the y-intercept MEAN in the context of the

b. The same company is advertising a deal on compact car rentals. The linear function y = 15 + 30x can be used to model the relationship between the number of days (x) and the total cost (y) of renting a compact car.

What is the fixed administrative fee? \Box

What is the rental cost per day?

When someone purchases a new car and begins to drive it, the resale value of the car (in dollars) goes down each year. This is called depreciation. Let x represent the number of years since purchase and y represent the resale value of the car (in dollars). The linear function that models this situation is y = 20000 - 1200x.

a. Identify and interpret the rate of change.

Rate of change - 1200. Every year, the value of car depreciates by \$1200 b. Identify and interpret the initial value. 20,000 - The New Car costs \$20,000

c. Is the function increasing or decreasing? What does this mean in the context of the story?

Car goes down.

Paid music download services like iTunes are a great way to enjoy lots of music. One service, iLoveMusic offers downloads of individual songs with the following price structure: a \$3 fixed fee for monthly subscription plus a fee of \$0.25 for each song you download. Another service, PinkUnicornMusic, has a competing offer that charges a fixed fee of only \$2 for monthly subscription, but they charge \$0.40 for each download.

a. Write a linear equation that represents the costs for each music service.

$$PVM \rightarrow y = .4x + a$$

b. What does the "initial value" and "rate of change" refer to in this situation?

Initial value monthly subscription

c. When is it better to subscribe to PinkUnicornMusic? How do you know? Graph the functions on a coordinate plane, or create tables that show the total costs for each subscription.

Corless 2 MM beter Tormore - silm beter

$$.25x+3 = .4x+2$$

$$-2$$

$$.25x+1 = .4x$$

$$-1 = .15x$$

A new amusement park is opening up and has three different options for its customers to consider in terms of pricing. Option A has patrons paying one price at the entrance gate, \$95.00 and getting on all rides for free. Option B involves paying nothing at the entrance gate, but then having to pay \$6 to get on each ride. Option C asks patrons to a reduced entrance fee of \$30, but then pay \$4 for each ride.

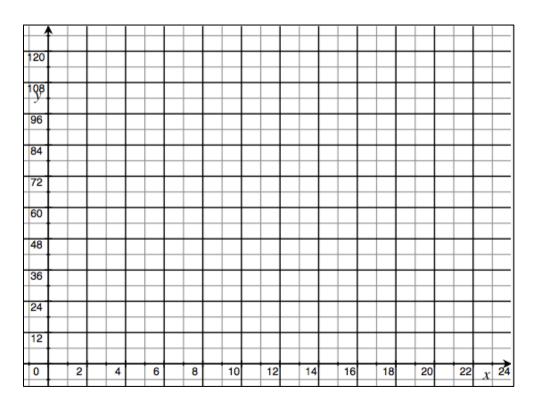

a. Let *x* be the number of rides you go on, and let *y* be the total cost for your entertainment. Write linear equations for each of the pricing options.

b. Explain what the slope means in this story. Which line has the steepest slope?

c. Graph each equation in the space provided, and indicate when you would purchase which option.
